RESEARCH SUMMARY

AI systems are deployed faster than their risks can be measured or controlled. My lab builds the methods, benchmarks, and open-source infrastructure that **make AI systems auditable** across the deployment stack: *anomaly and out-of-distribution detection in data, trust and robustness evaluation of foundation models*, and *auditability and control of agent systems across their lifecycle*. One agenda runs through the work: detect, diagnose, and control departures from expected behavior, from anomalous data and foundation-model failures to consequential agent actions. The current frontier is **agent auditability**: deployable open-source infrastructure that audits agents from before deployment to after a run.

1. Agent Layer: Auditability and Control

At the agent layer, deployed systems act through tools, APIs, and shared state, making behavior the primary failure surface. This thread covers auditability frameworks, runtime control surfaces, agent-specific failure modes, and post-run attribution and recovery, spanning the full lifecycle from pre-deployment to after a run.

2. Foundation-Model Layer: Trust and Robustness

Foundation models add a new failure surface between data and agents: behavior under attack, hallucination, and adversarial robustness of retrieval. My lab measures these surfaces through jailbreak detection for vision-language models, causal analysis of hallucination, retrieval-augmented generation attacks, and LLM-as-anomaly-detector benchmarks.

- ☐ Multimodal Trust

3. Data Layer: Anomaly and Out-of-Distribution Detection

All audit grounds in distinguishing in-distribution from out-of-distribution behavior. This is my methodological root, started with the PyOD ecosystem and ADBench, and continuing through benchmarks for NLP, automatic OOD detector selection, and modality-specific OOD methods for graphs, multimodal data, and video.

- ☐ Anomaly Detection
- ☐ Outlier Detection
- ☐ Out-of-Distribution Detection
- ☐ Distribution Shift
- ☐ Multimodal OOD

- ☐ Benchmark Design

Tools from this group have been cited in a U.S. Senate committee report, a NIST special publication, and the U.S. Department of Defense Generative AI Toolkit. PyOD was selected by the European Space Agency for spacecraft anomaly detection and is the subject of five published books. TrustLLM serves as an official

benchmark in all three editions of the Future of Life Institute AI Safety Index.
